Regional AMR surveillance as a basis of co-reactive prevention and control

Hajo Grundmann, University Medical Centre Freiburg, Germany

No COI to declare

What I will not talk about

- Population-based surveillance, potential for determining risk or burden of disease
- Patient-based surveillance, determining appropriate antibiotic therapy (ABS – effectiveness)

What I will talk about

- Pathogen-based surveillance

And that can be translated into regional AMR surveillance as a basis of co-reactive prevention and control

(Which is a challenge but can be achieved)

Overview

- Phylogeography of High Risk Clones
- Transmission
- Network properties

Population structure of *K. pneumoniae* from a global collection (n=328)

Population structure of *K. pneumoniae* in Europe: Clinical isolates from the EuSCAPE collection (n=1717)

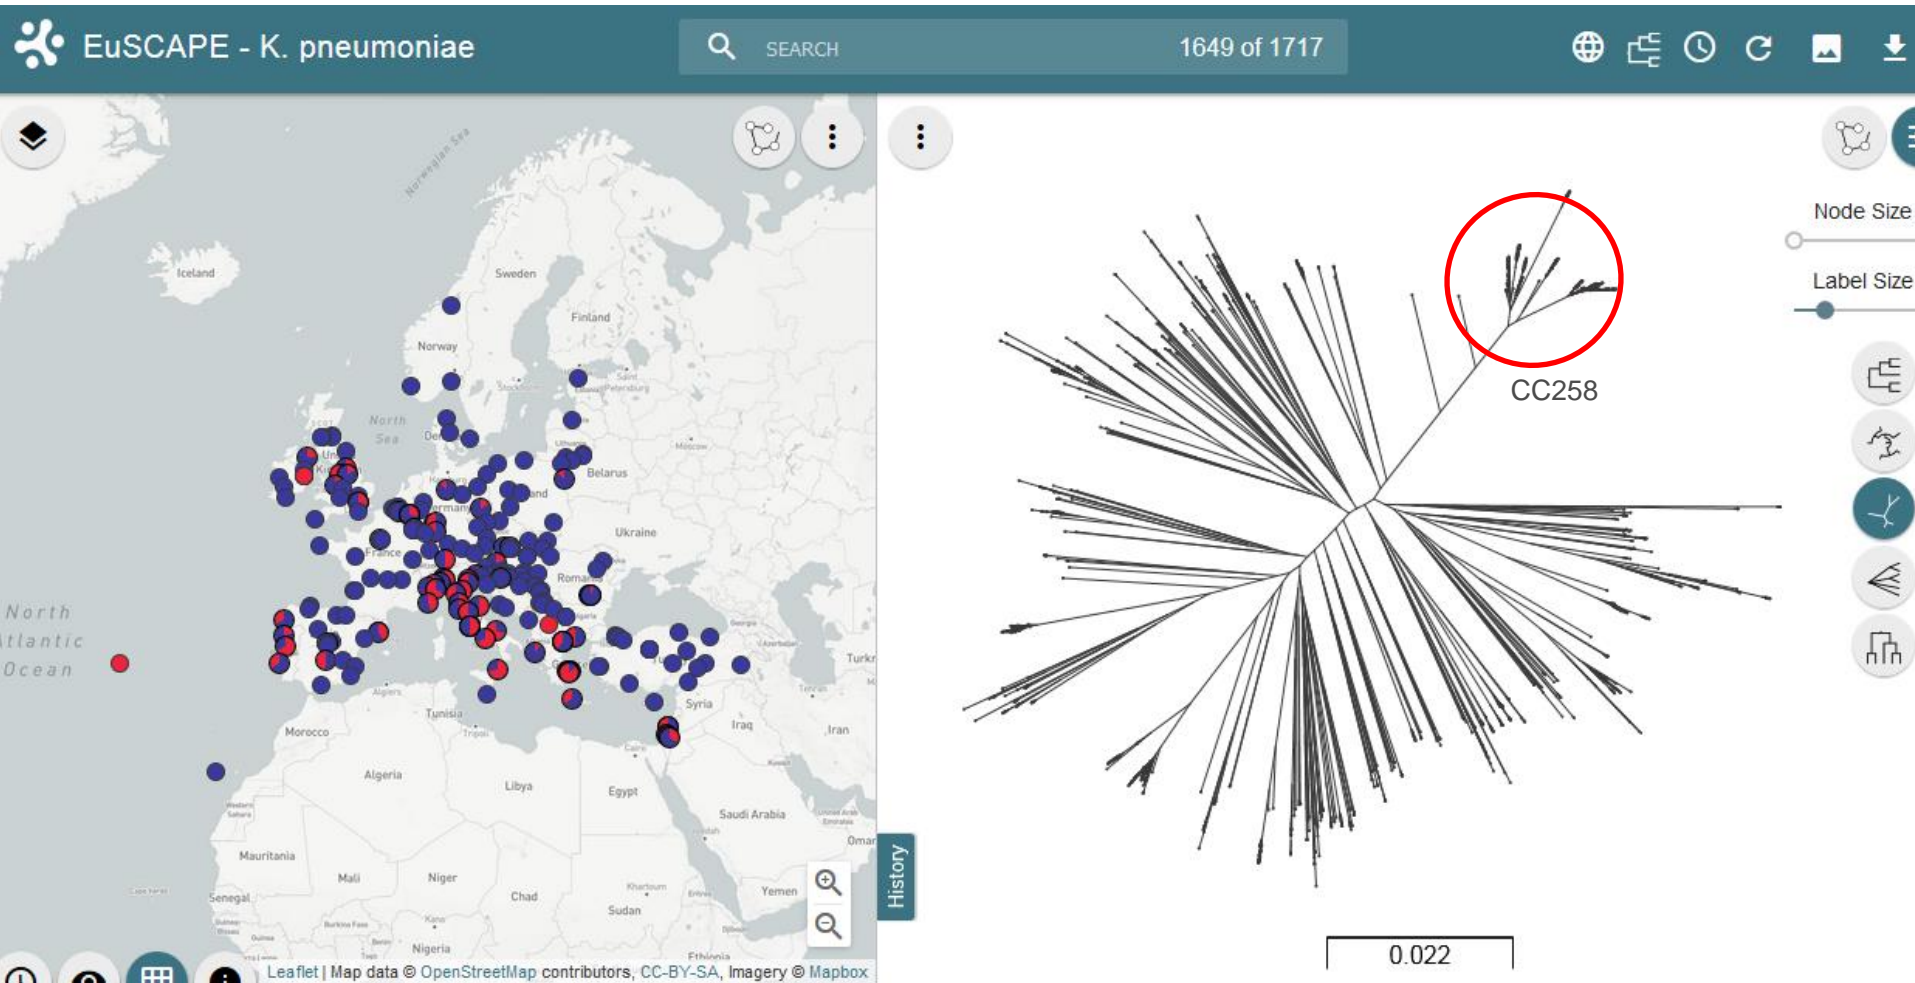

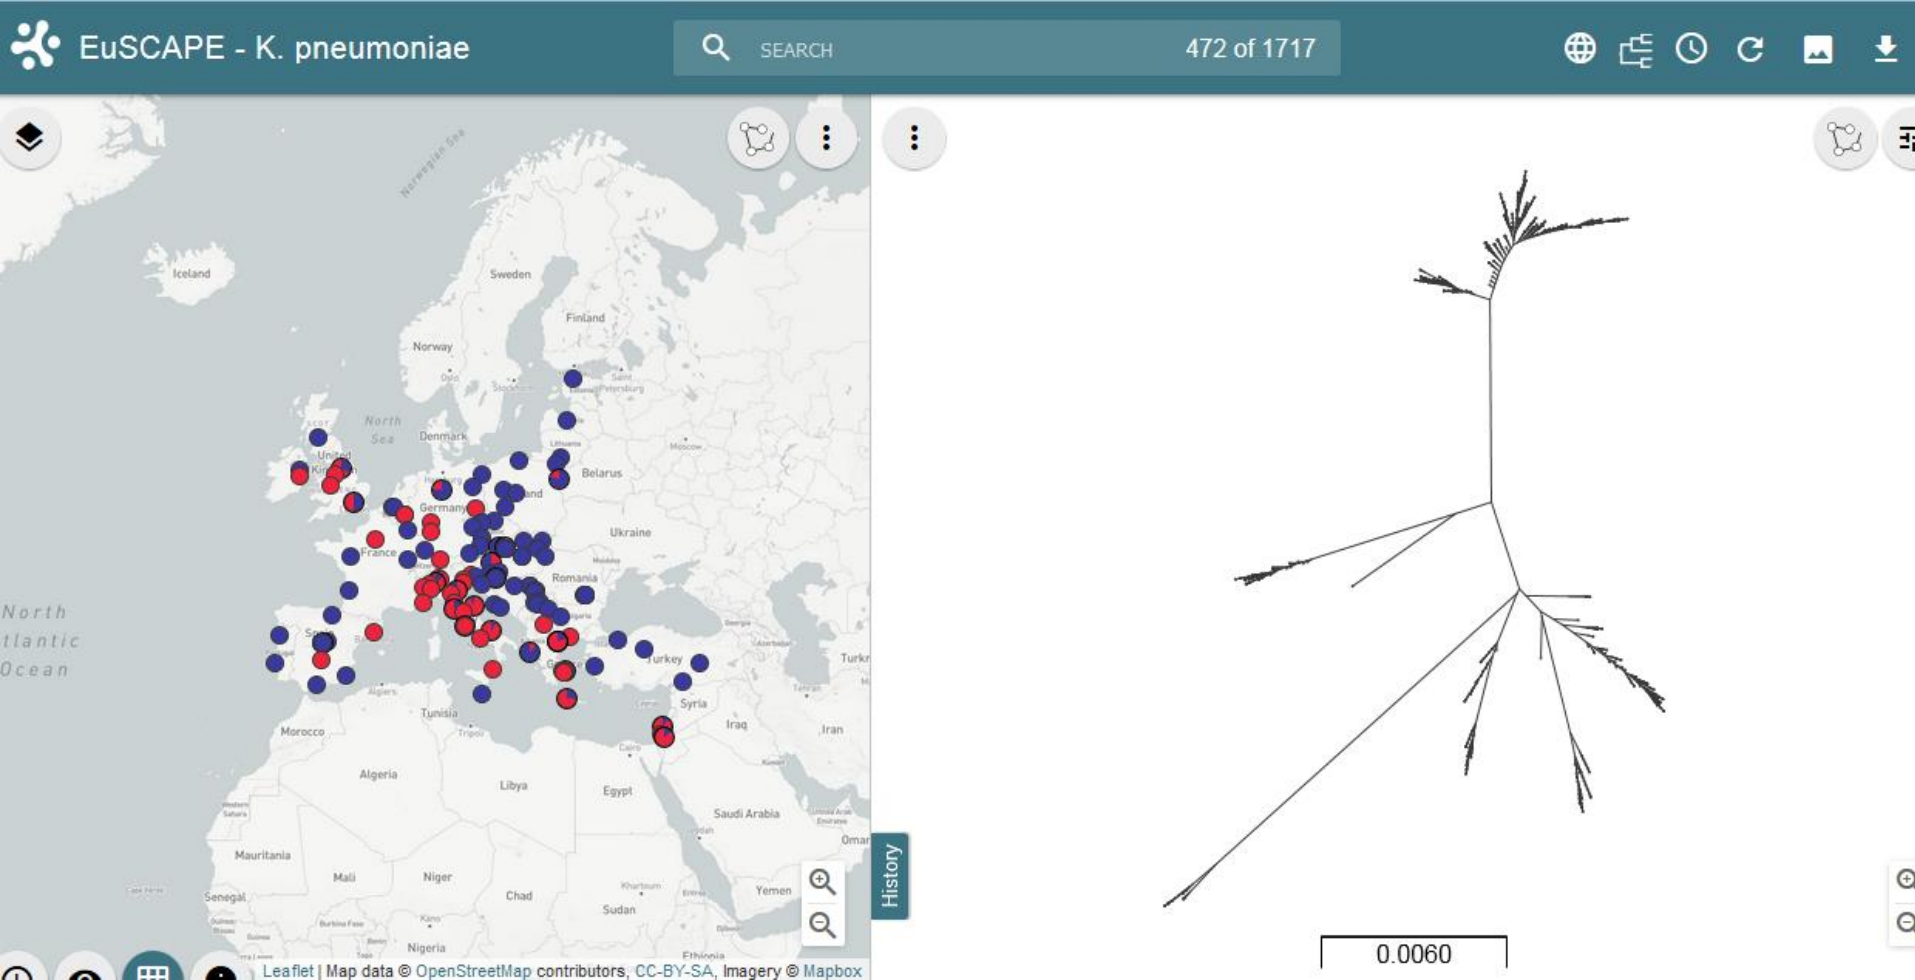

Population structure of *K. pneumoniae* in Europe: Clinical isolates from the EuSCAPE collection (n=1717)

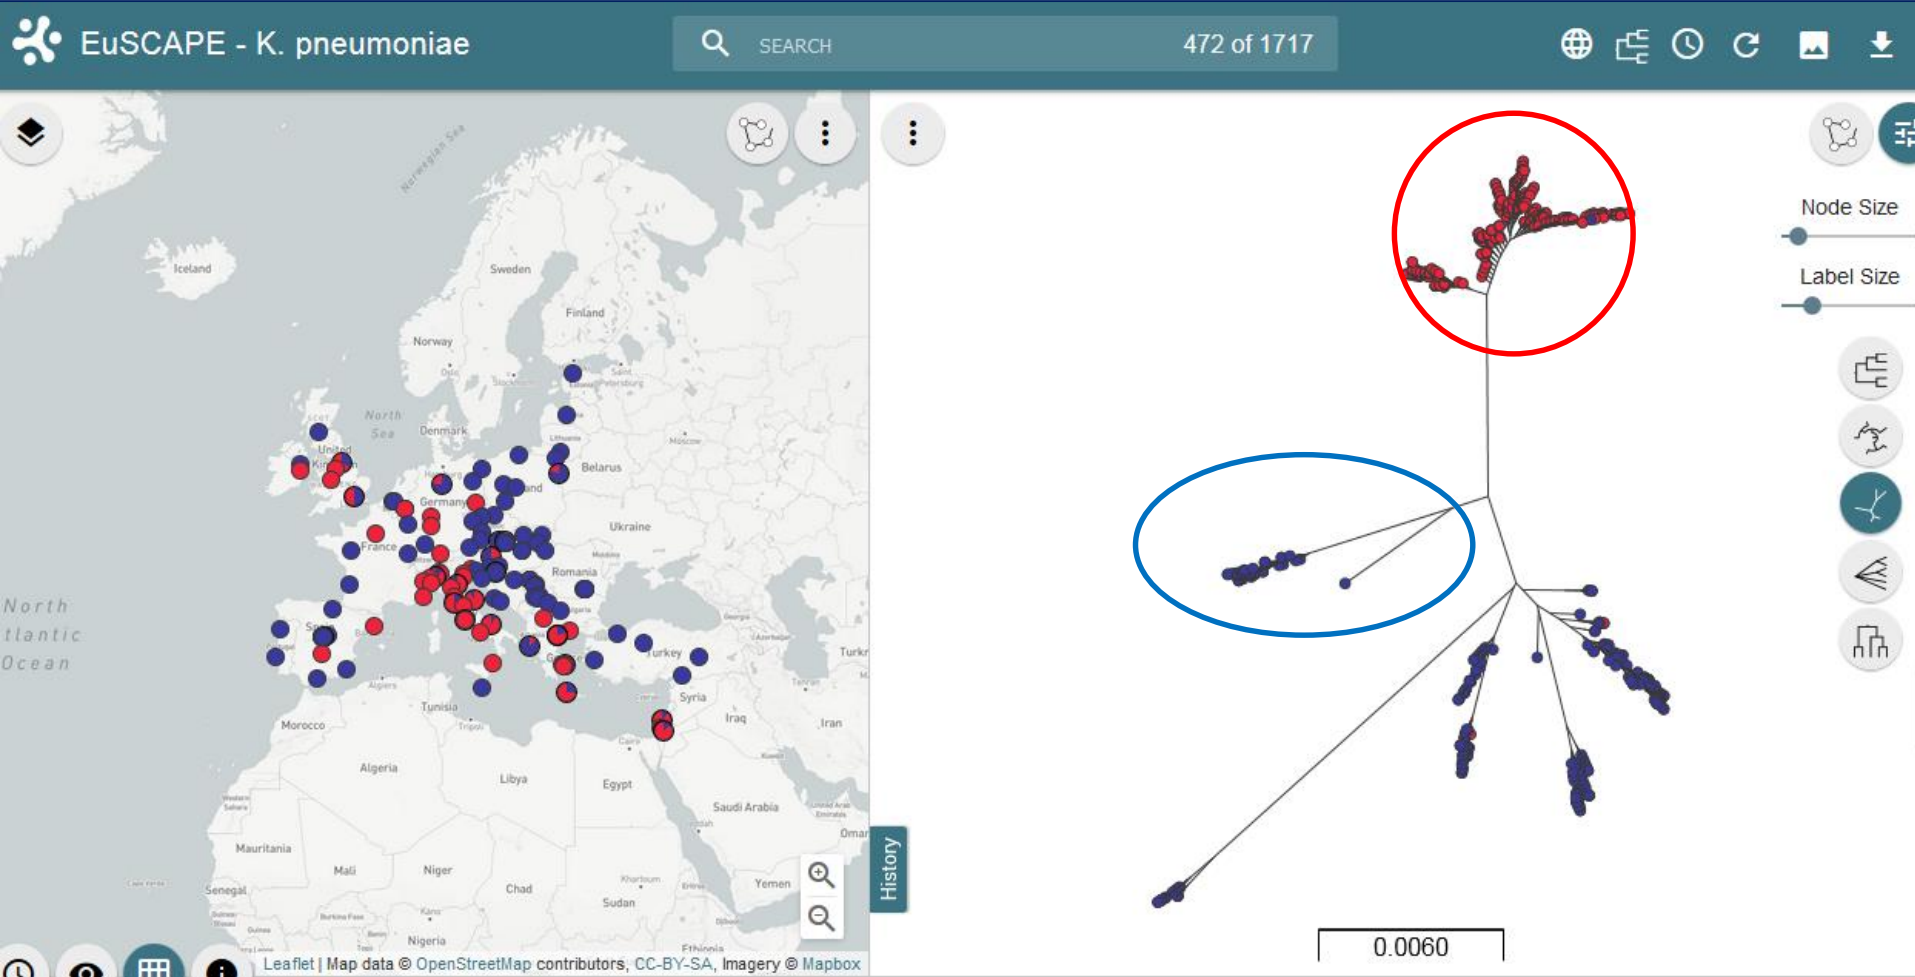

Population structure of *K. pneumoniae* in Europe: Phylogroup Kpl (n=1649)

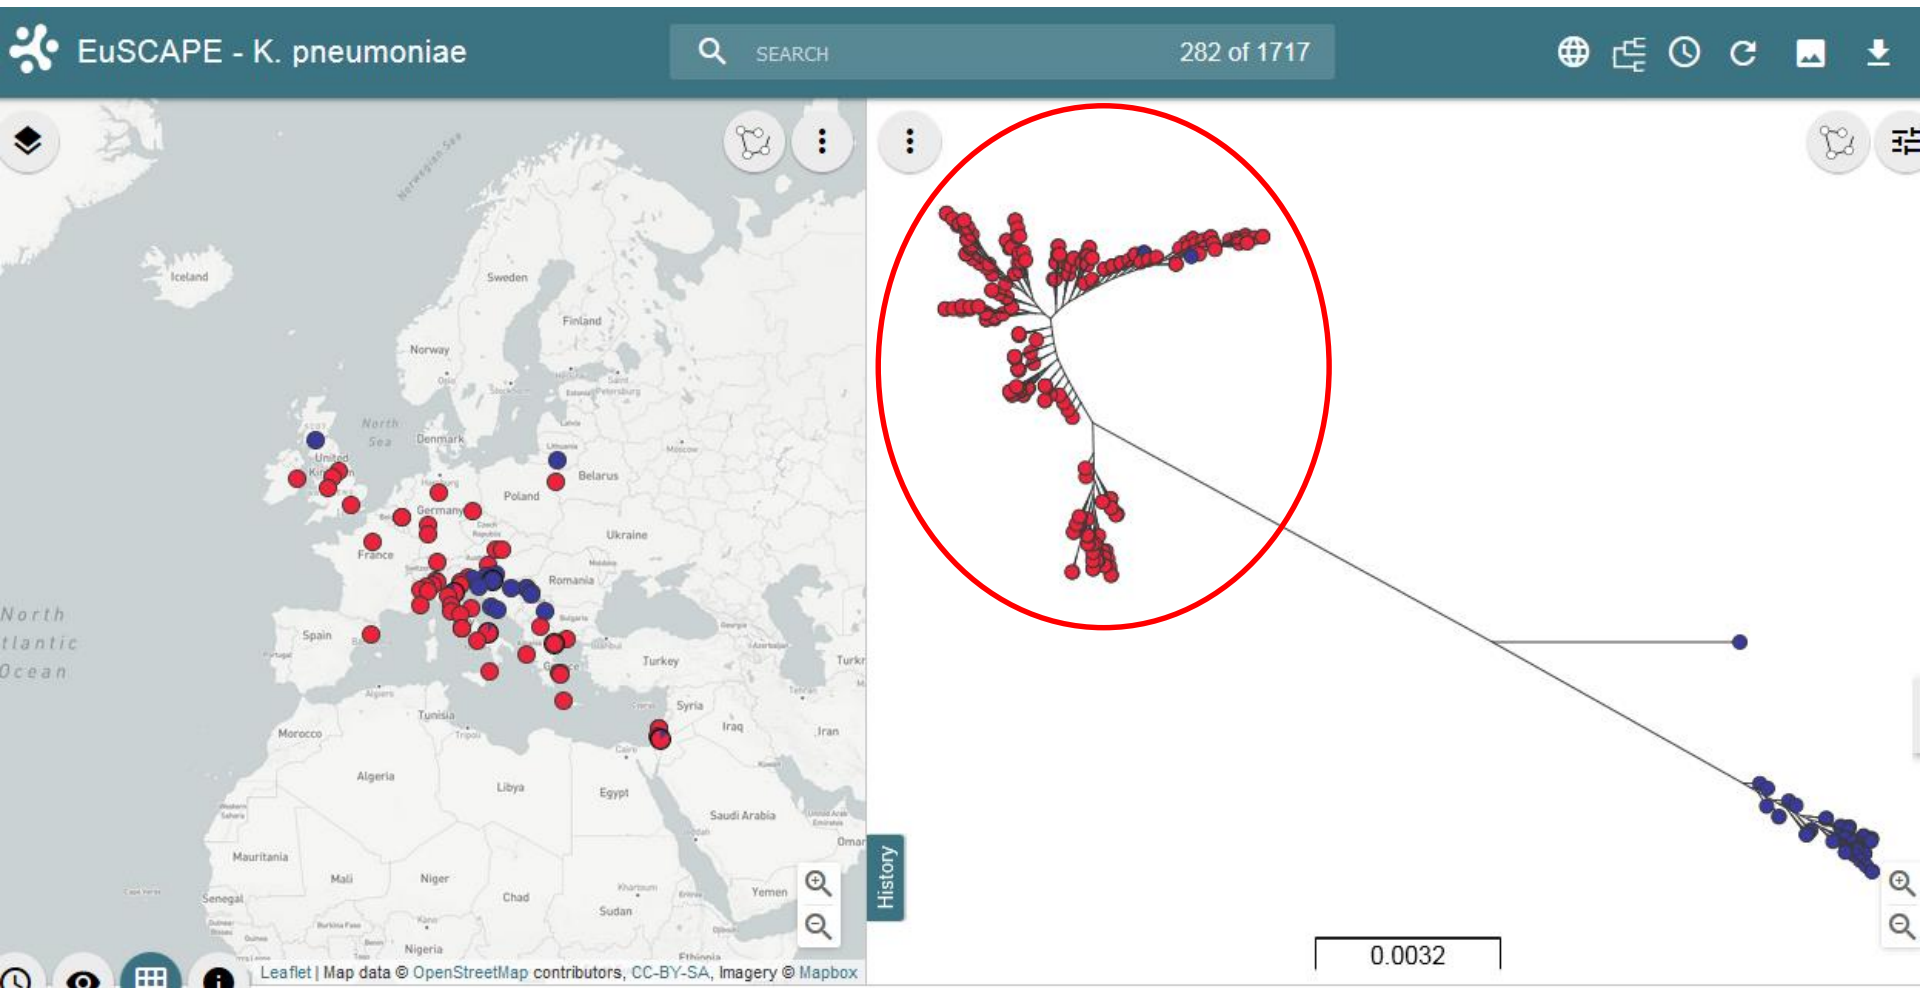

Population structure of *K. pneumoniae* in Europe: Clonal complex 258 (n=472)

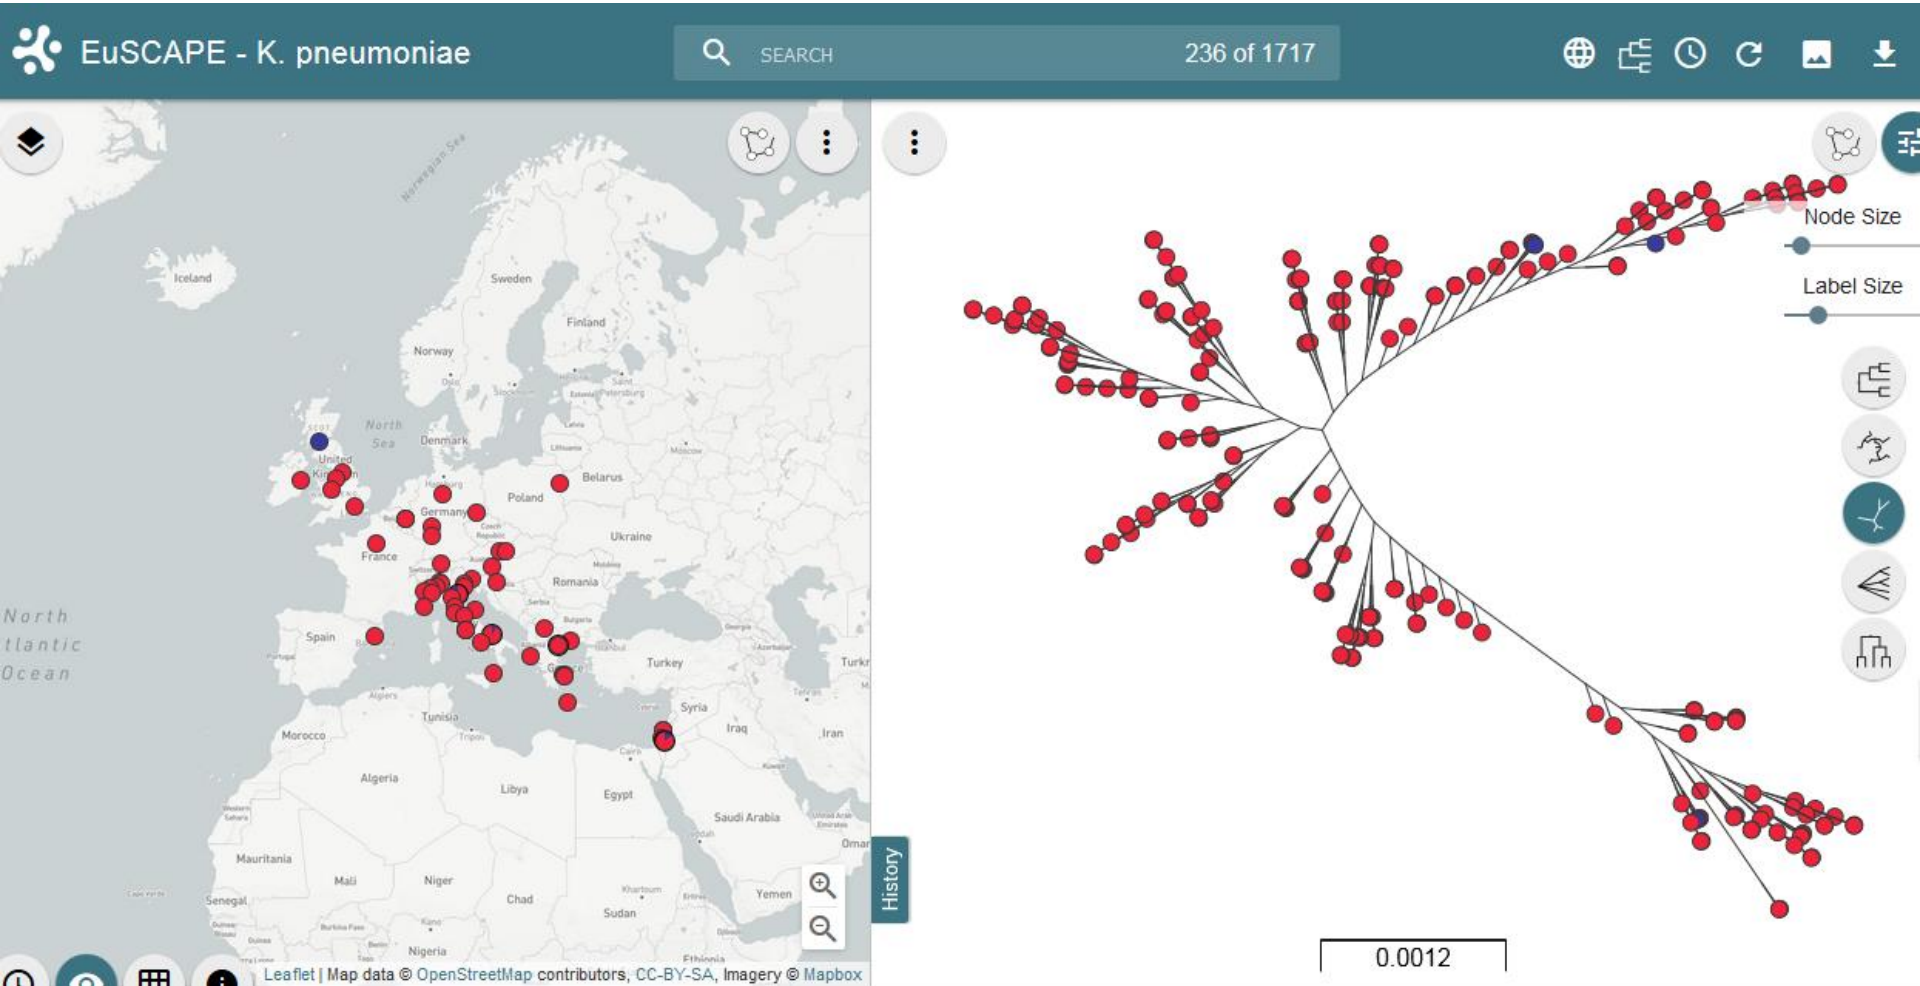

Population structure of *K. pneumoniae* in Europe: Sequence type 258 & 512 (n=236)

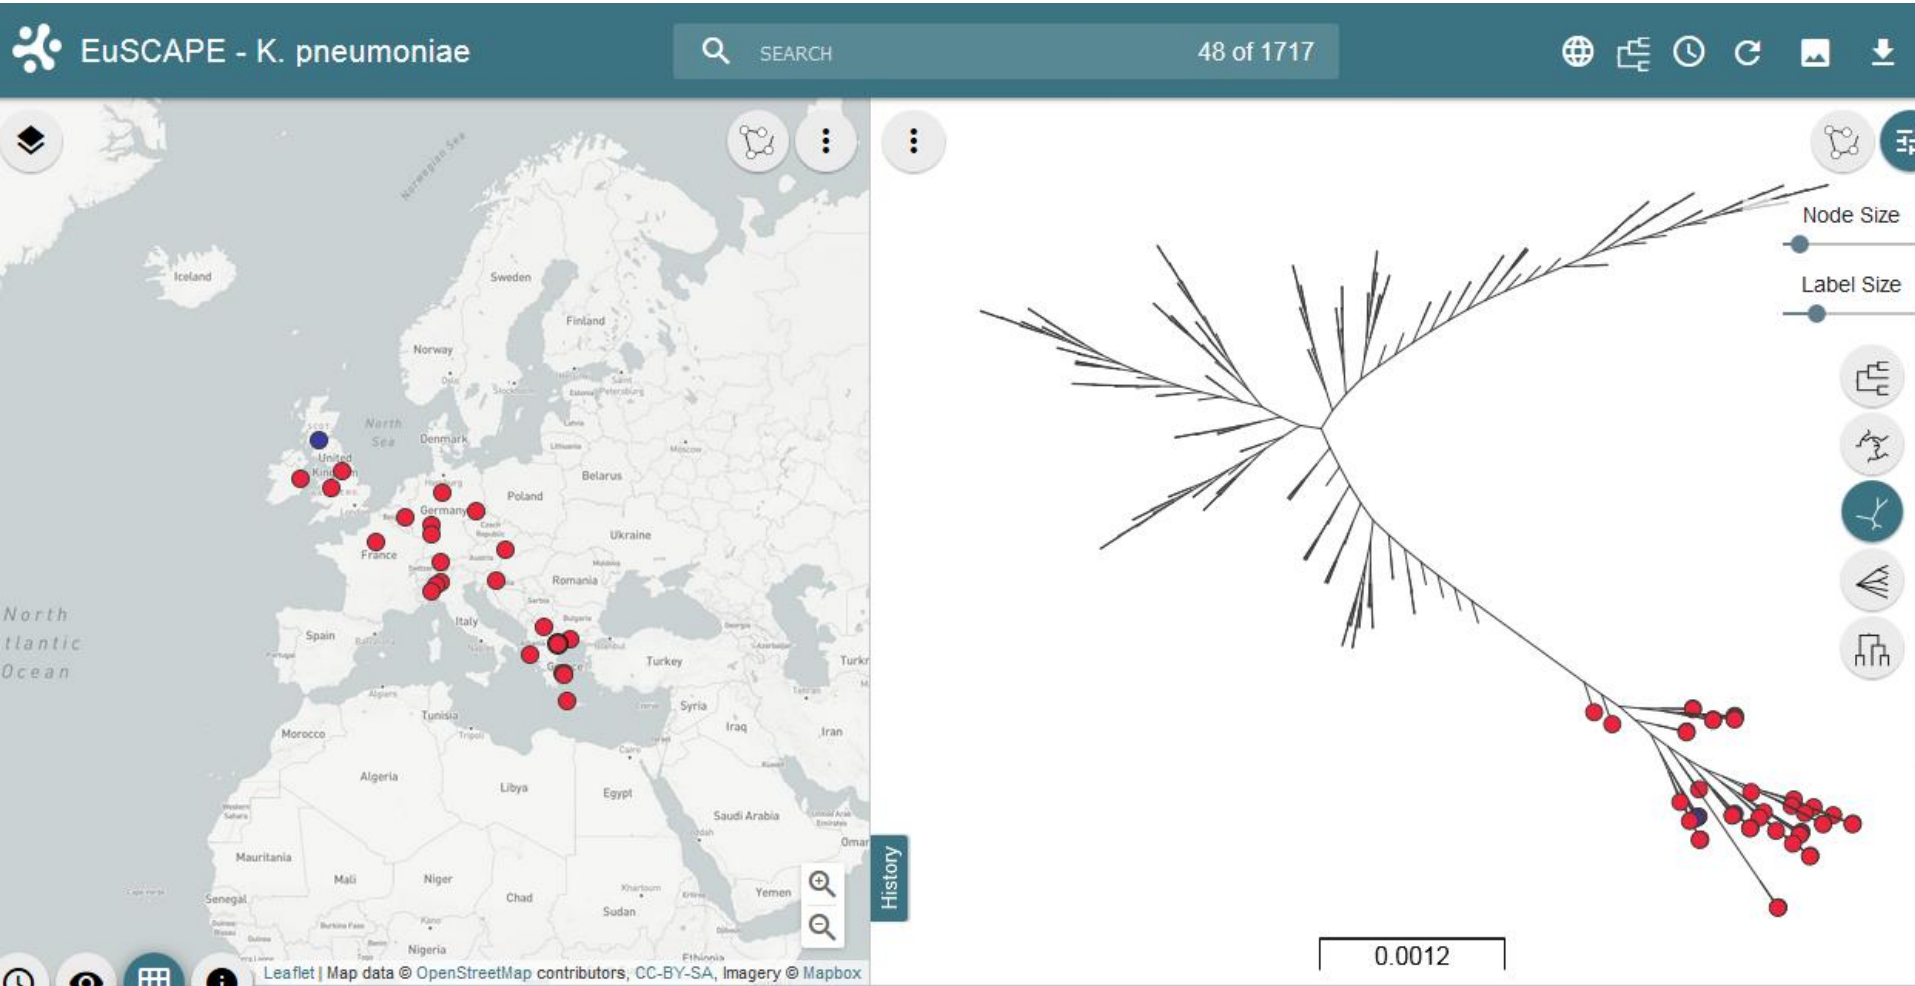

Population structure of *K. pneumoniae* in Europe: Sequence type 258 & 512 (n=236)

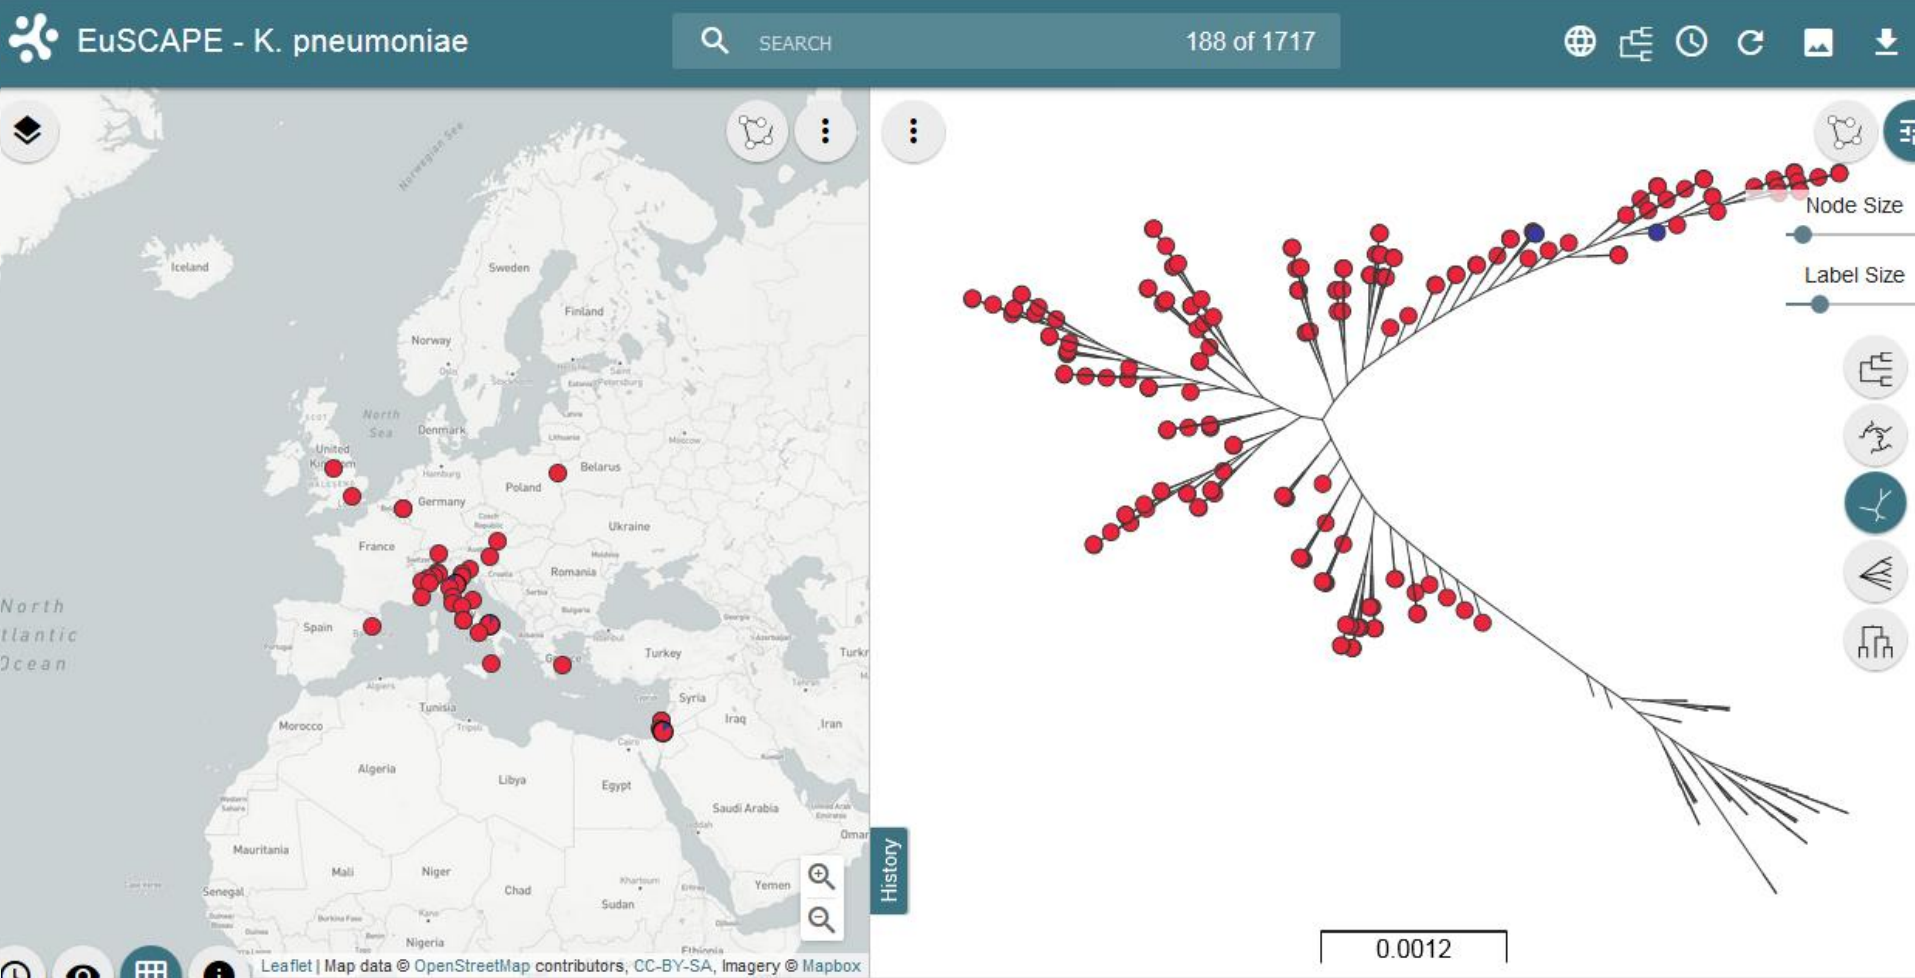

Population structure of *K. pneumoniae* in Europe: Sequence type 258 & 512 (n=236)

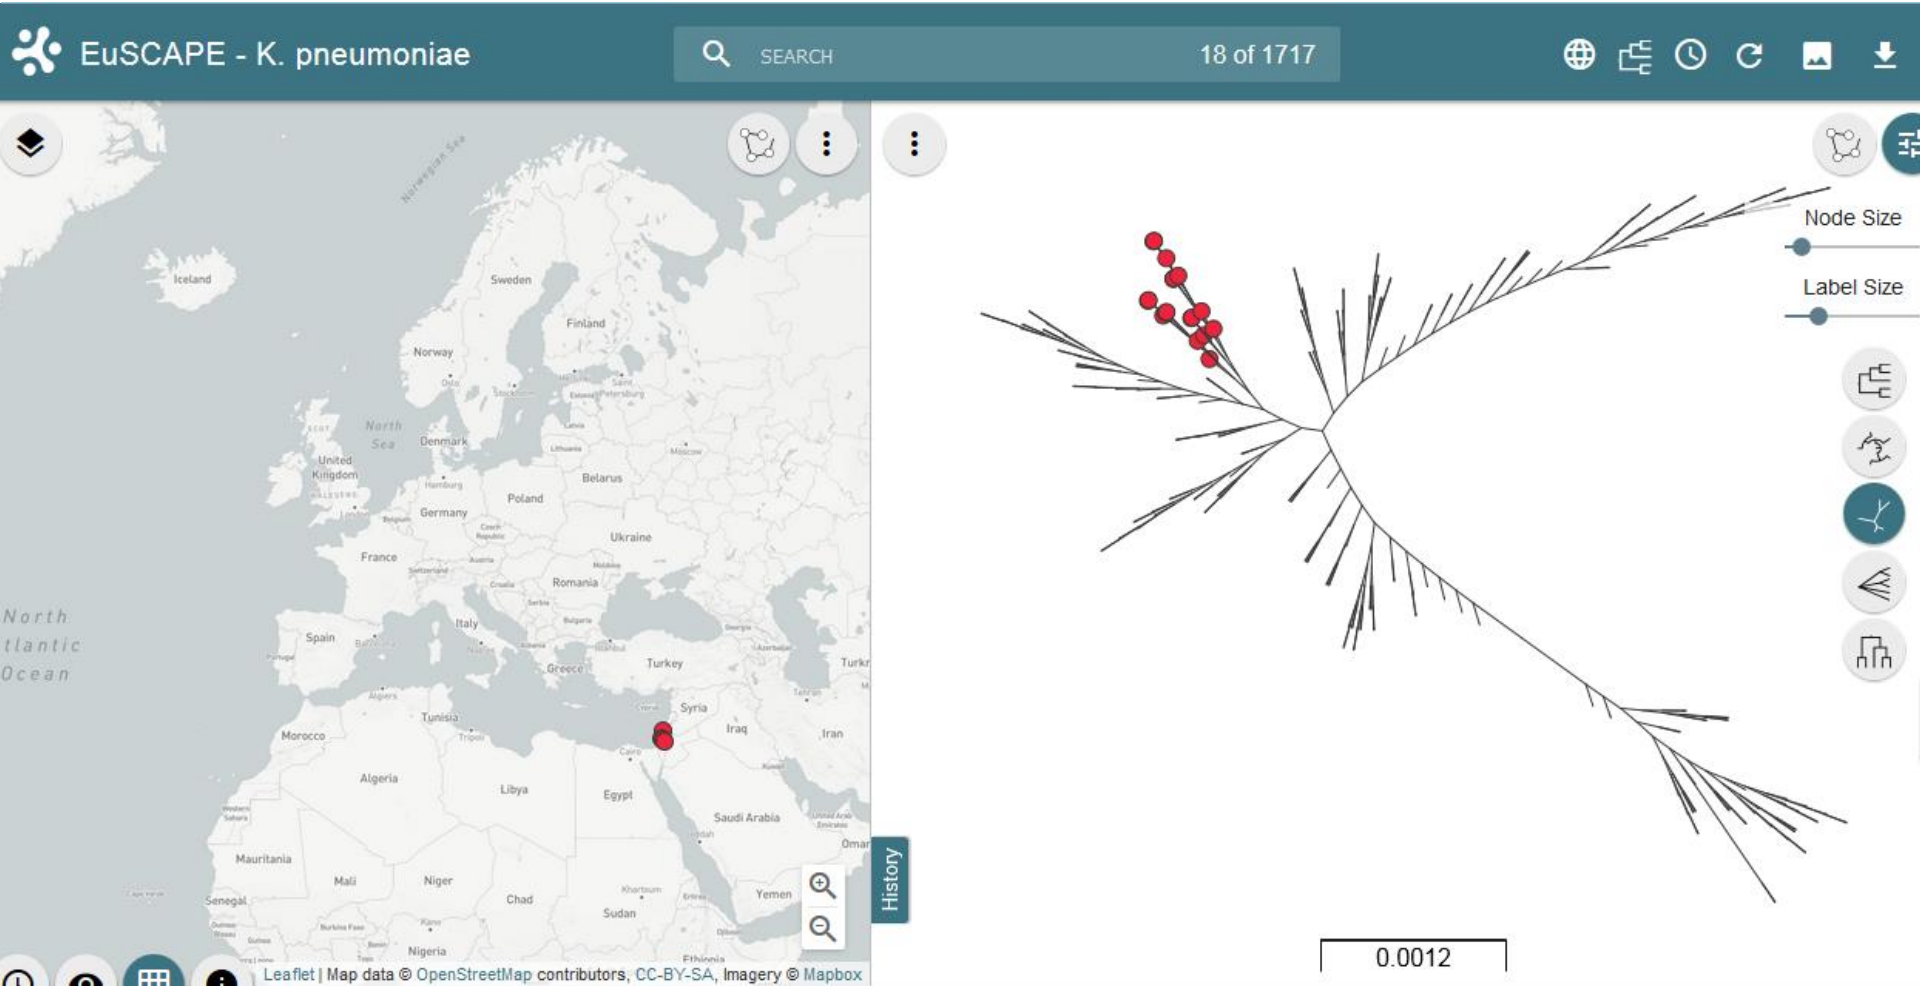

Population structure of *K. pneumoniae* in Europe: Sequence type 258 (n=48) 27 are from Greece

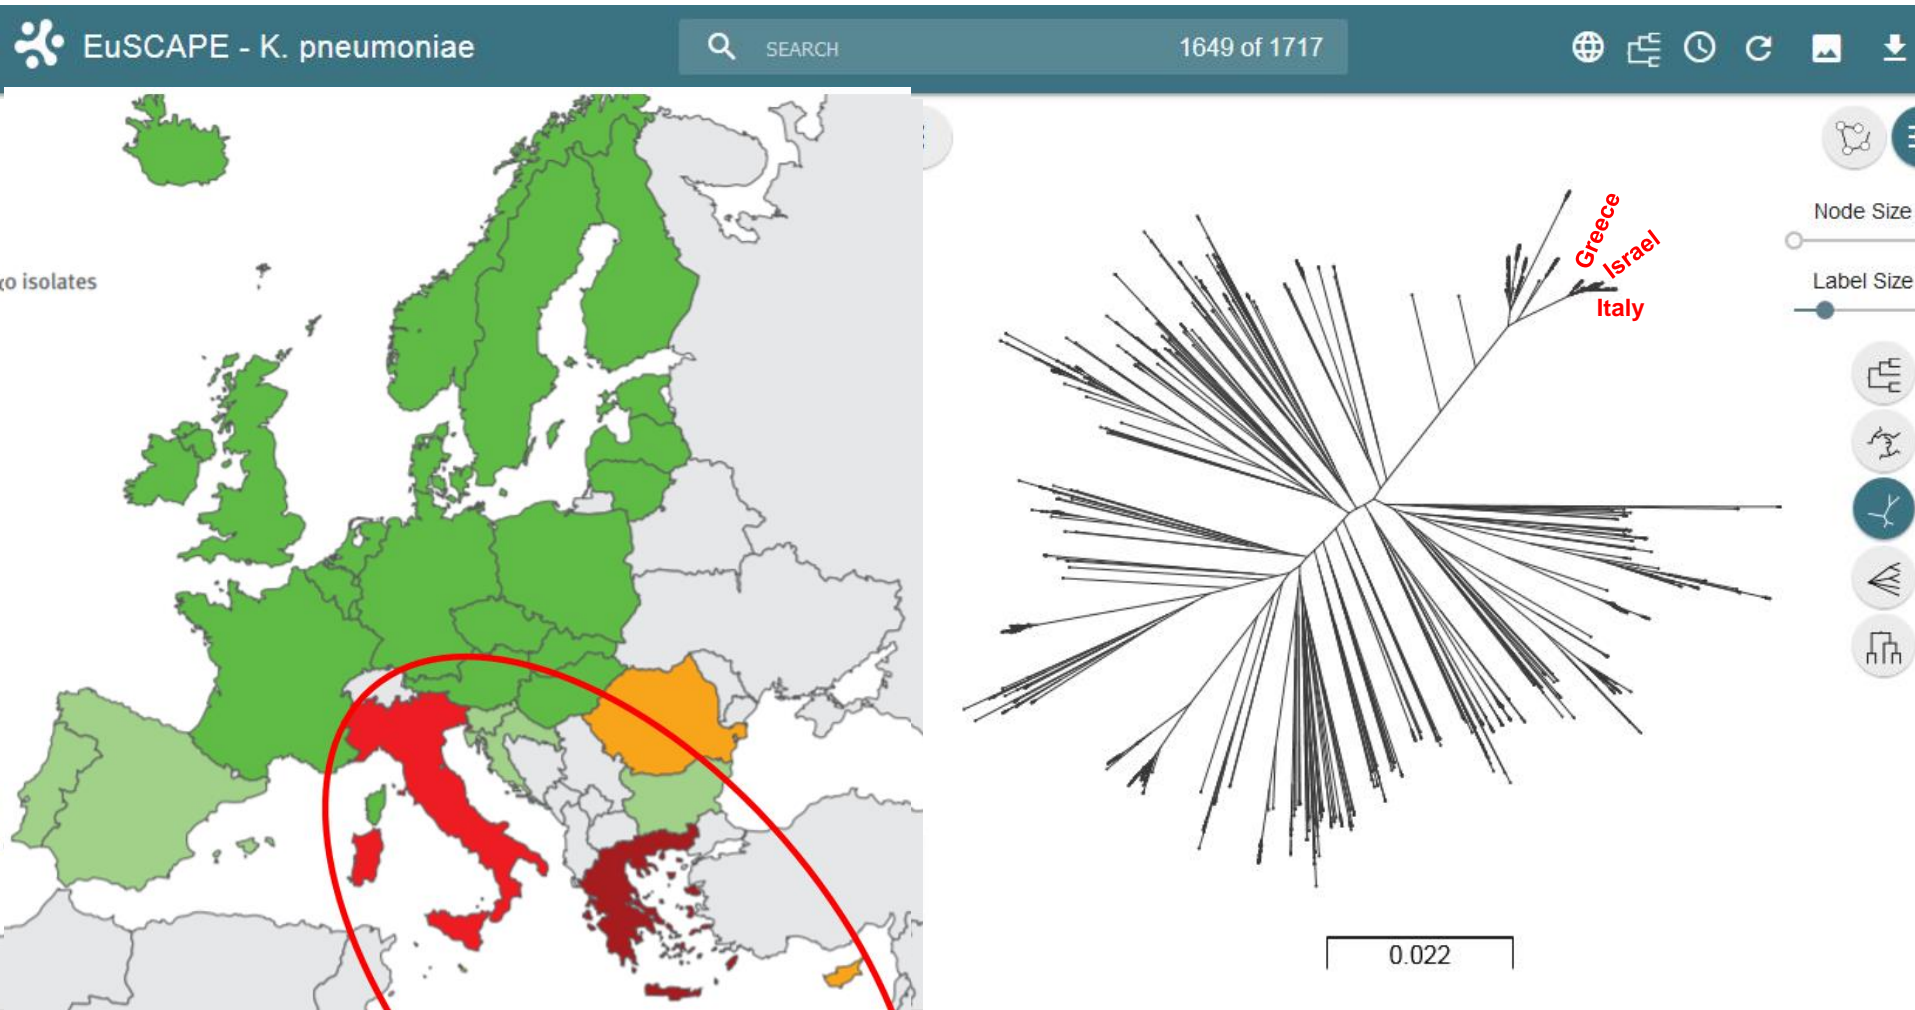

Population structure of *K. pneumoniae* in Europe: Sequence type 512 (n=188) 113 are from Italy

Population structure of *K. pneumoniae* in Europe: Sequence type 512 (n=188) 18 are from Isreal

Population structure of *K. pneumoniae* in Europe: Clonal expansion of KPC2-producing *K. pneumoniae* 2013

Transmission

A property of all but a privilege of a few

Not only a property of infectious agents but also a property of the host

National patient referral networks

National patient referral networks

National patient referral networks

The English health care network

51.1 million inhabitants in England in 2007

From the NHS Hospital Episode Statistics (HES)

- Financial Year 2007

146 acute care hospital trusts

- 25 University hospitals
- 42 Large acute care
- 50 Medium acute care
- 29 Small acute care

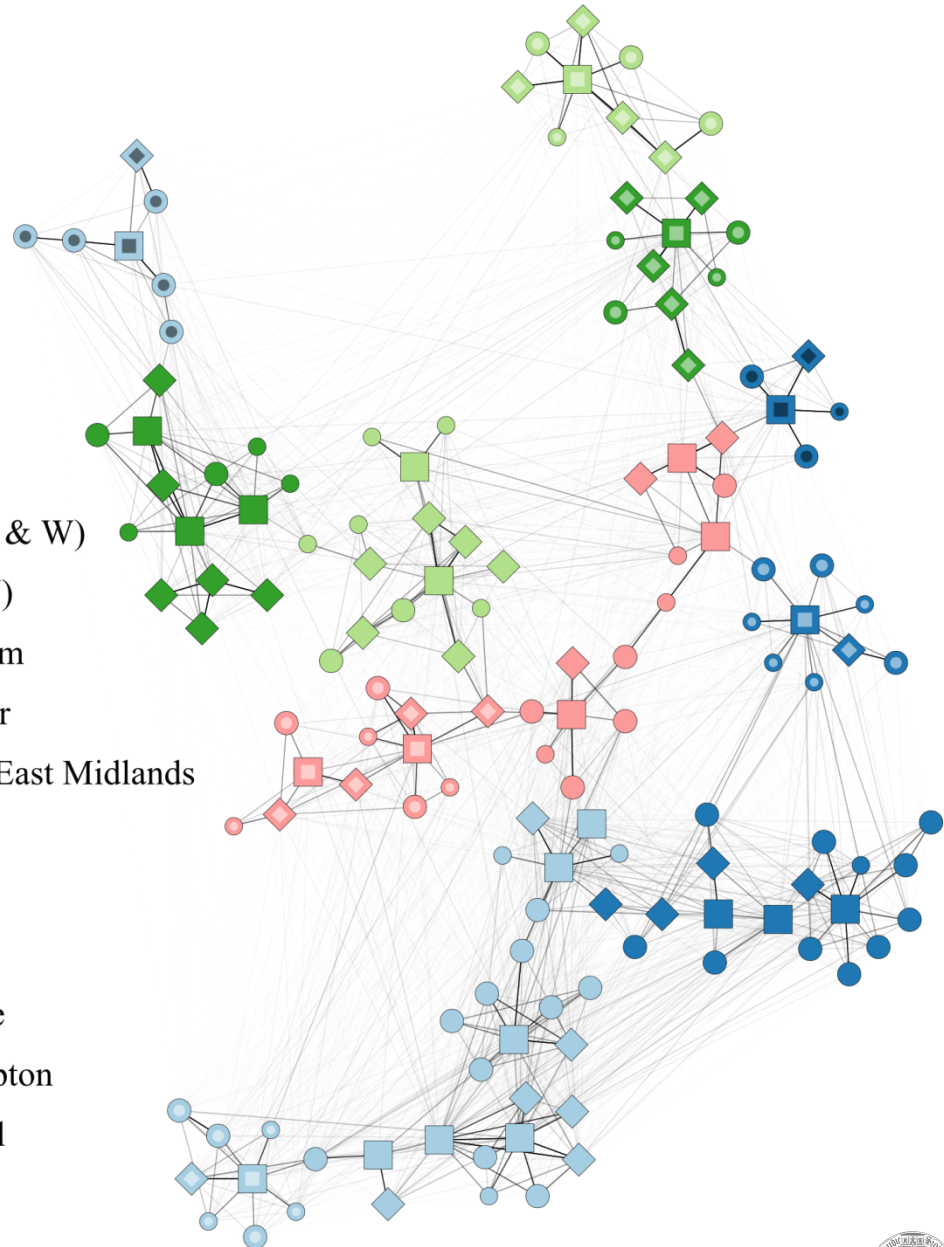

7.4 million patients

12.9 million admissions

Live-saving research investments in AMR (One-Health is it, or is it?)

How are we going to reconcile the epidemic spread of AMR associated high risk clones with a One Health approach?

Incidence of colonization and bloodstream infection with carbapenem-resistant Enterobacteriaceae in children receiving antineoplastic chemotherapy in Italy.

Caselli D, et al. Infect Dis (Lond). 2016.

[Show full citation](#)

Abstract

Few data are available on the incidence of carbapenemase-producing Enterobacteriaceae (CPE) infection or colonization in children receiving anticancer chemotherapy. We performed a nationwide survey among centers participating in the pediatric hematology-oncology cooperative study group (Associazione Italiana Ematologia Oncologia Pediatrica, AIEOP). During a 2-year observation period, we observed a threefold increase in the colonization rate, and a fourfold increase of bloodstream infection episodes, caused by CPE, with a 90-day mortality of 14%. This first nationwide Italian pediatric survey shows that the circulation of CPE strains in the pediatric hematology-oncology environment is increasing. Given the mortality rate, which is higher than for other bacterial strains, specific monitoring should be applied and the results should have implications for health-care practice in pediatric hematology-oncology.

PMID: 26393496 [PubMed - indexed for MEDLINE]

Are we well advised to spend scarce research resources on a One Health approach if we want to save patients' lives in European hospitals?

Given the limited supply of research funding, I regard it as irresponsible to portray a One Health approach as beneficial for patients that are at risk of infections with AMR pathogens in our hospitals !

Conclusions

- Transmission of health care-associated MDROs is characterized by highly non-normal dynamics, whereby few cause many and many cause few.
- Infection control measures should regard regional health care networks and not only individual hospitals as the target for interventions.
- Real-time patient tracking combined with rapid genomic analysis is essential for the early management of emergence and introduction of High Risk Clones into regional referral networks.
